

WHAT IS CLAIMED IS:

1. A digital video reproduction method for at least reproducing image based on video contents and metadata, wherein
 - 5 said video contents include an event scene, wherein said event scene is peculiar to a motion picture;
 - 10 said metadata comprises at least event information data having a designation of a starting position and contents of said event scene; and
 - 15 said digital video reproduction method comprises the steps of using said event information data and reproducing an image from said event scene selected by a spectator.
 2. The digital video reproduction method according to claim 1, wherein said metadata includes information on reproduction time related to video contents, wherein said digital video reproduction method comprises the steps of:
 - 20 displaying a timeline on a display apparatus screen as a time bar during reproduction of said image or upon an operation by a spectator at a time of starting reproduction, wherein said time bar corresponds to a reproduction time of video contents, and said video contents are based on said reproduction time;
 - 25 displaying an icon corresponding to said event scene on a starting position of said event scene on said time bar, wherein said displaying is based on said event information data; and
 - 30 reproduction of image from a starting position of said event scene corresponding to said icon, wherein said icon is a icon selected by a spectator.
 3. The digital video reproduction method according to claim 1, wherein when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire

reproduction time of said video contents, said digital video reproduction method further comprises the steps of:

displaying a portion of said time bar as an expanded time bar, wherein said portion of said time bar includes a selected position on said time bar;

5 and

displaying an icon on said expanded time bar, wherein said icon corresponds to an event scene included in said portion of said time bar.

4. The digital video reproduction method according to claim 1, wherein

10 when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said digital video reproduction method further comprises the steps of:

15 determination of a selected reproduction time partition, wherein said reproduction time partition is selected from a timeline corresponding to an entire reproduction time;

displaying a scrolling time bar, wherein said scrolling time bar corresponds to said selected reproduction time partition;

20 displaying said icon on said scrolling time bar, wherein said icon corresponds to an event scene included in said selected reproduction time partition;

scrolling said selected reproduction time partition, wherein a direction of said scrolling is designated by a spectator;

25 displaying said scrolling time bar corresponding to a reproduction time partition after said scrolling; and

displaying an icon corresponding to an event scene included in said reproduction time partition after scrolling.

30 5. The digital video reproduction method according to claim 1, wherein when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are

displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said digital video reproduction method further comprises the steps of:

splitting and displaying said time bar in a plurality of non linear partitions, wherein a time density of said displaying is set minimum for a partition selected by a spectator and maximum for a partition located far from said selected partition; and

displaying an icon corresponding to an event scene included in each of said partitions, wherein said icon is displayed only when said icon does not overlap with another icon when displayed.

6. A digital video reproducing apparatus, comprising:

a storage means for storing video contents and metadata, wherein

said video contents include an event scene, wherein said event scene is peculiar to a motion picture; and

said metadata comprises at least event information data having a designation of a starting position and contents of said event scene; and

a means for controlling image reproduction based on said video contents and said metadata, wherein said means for controlling image at least reproduces image; wherein

said video reproducing apparatus connected to a display apparatus includes said means for controlling image reproduction using said event information data and reproducing image from an event scene selected by a spectator.

7. The digital video reproducing apparatus according to claim 6, wherein each of said event information data includes an attribute related to said event scene;

said digital video reproducing apparatus has a search means for searching an event information data having said attribute, wherein said attribute is selected from all event information data stored in said storage; and

5 said means for controlling image reproduction reproduces image from an event scene corresponding to an event information data, wherein said event information data is selected by a spectator from said event information data searched by said search means.

10 8. The digital video reproducing apparatus according to claim 6, wherein
 said metadata includes reproduction time information related to video
 contents;

15 said digital video reproducing apparatus comprises a means for
 displaying a secondary image, wherein during reproduction of said image or
 upon operation by a spectator, said means for displaying the secondary
 image displays:

20 a timeline on a display apparatus screen as a time bar based on
 said reproduction time information, wherein said timeline corresponds
 to a reproduction time of video contents; and

25 an icon on a starting position of said event scene on the time bar
 based on said event information data, wherein said icon corresponds to
 said event scene; and

30 said means for controlling image reproduction reproduces image from
 a starting position of said event scene, said event scene corresponding to
 said icon selected by a spectator.

35 9. The digital video reproducing apparatus according to claim 8, wherein
 each of said event information data includes an attribute related to said
 event scene;

40 said digital video reproducing apparatus has a search means for
 searching an event information data having said attribute, wherein said
 attribute is selected from all event information data stored in said storage;
 and

45 said means for controlling image reproduction reproduces image from
 an event scene corresponding to an event information data, wherein said
 event information data is selected by a spectator from said event information

data searched by said search means.

10. The digital video reproducing apparatus according to claim 8, wherein
when recognition of said icon by a spectator is difficult when all icons

5 corresponding to said event scene included in said video contents are
displayed on said time bar, wherein said time bar corresponds to an entire
reproduction time of said video contents, said means for displaying the
secondary image displays:

a portion of said time bar as an expanded time bar, wherein said
10 portion of said time bar includes a selected position on said time bar;
and

an icon on said expanded time bar, wherein said icon corresponds
to an event scene included in said portion of said time bar.

15. 11. The digital video reproducing apparatus according to claim 10, wherein
each of said event information data includes an attribute related to said
event scene;

said digital video reproducing apparatus has a search means for
searching an event information data having said attribute, wherein said
20 attribute is selected from all event information data stored in said storage;
and

said means for controlling image reproduction reproduces image from
an event scene corresponding to an event information data, wherein said
event information data is selected by a spectator from said event information
25 data searched by said search means.

12. The digital video reproducing apparatus according to claim 8, wherein
when recognition of said icon by a spectator is difficult when all icons
corresponding to said event scene included in said video contents are
30 displayed on said time bar, wherein said time bar corresponds to an entire
reproduction time of said video contents, said means for displaying the
secondary image:

JP 2009-000000

determines a selected reproduction time partition, wherein said reproduction time partition is selected from a timeline corresponding to an entire reproduction time;

5 displays a scrolling time bar, wherein said scrolling time bar corresponds to said selected reproduction time partition;

 displays said icon on said scrolling time bar, wherein said icon corresponds to an event scene included in said selected reproduction time partition;

10 scrolls said selected reproduction time partition, wherein a direction of scrolling is designated by a spectator;

 displays said time bar, wherein said time bar corresponds to a reproduction time partition after said scrolling; and

 displays an icon, wherein said icon corresponds to an event scene included in said reproduction time partition after scrolling.

15 13. The digital video reproducing apparatus according to claim 12, wherein each of said event information data includes an attribute related to said event scene;

20 said digital video reproducing apparatus has a search means for searching an event information data having said attribute, wherein said attribute is selected from all event information data stored in said storage; and

25 said means for controlling image reproduction reproduces image from an event scene corresponding to an event information data, wherein said event information data is selected by a spectator from said event information data searched by said search means.

30 14. The digital video reproducing apparatus according to claim 8, wherein when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said means for displaying the

secondary image:

splits and displays said time bar in a plurality of non linear partitions, wherein a time density is set minimum for a partition selected by a spectator and maximum for a partition located far from said selected partition; and

displays an icon corresponding to an event scene included in each of said partitions, wherein said icon is displayed only when said icon does not overlap with another icon when displayed.

10 15. The digital video reproducing apparatus according to claim 14, wherein each of said event information data includes an attribute related to said event scene;

15 said digital video reproducing apparatus has a search means for searching an event information data having said attribute, wherein said attribute is selected from all event information data stored in said storage; and

20 said means for controlling image reproduction reproduces image from an event scene corresponding to an event information data, wherein said event information data is selected by a spectator from said event information data searched by said search means.

16. A digital video reproducing apparatus, comprising a communication means for receiving video contents and metadata, wherein

25 said video contents include an event scene, wherein said event scene is peculiar to a motion picture; and

30 said metadata comprises at least event information data having a designation of a starting position and contents of said event scene; and a means for controlling image reproduction for at least reproducing image based on said video contents and said metadata; wherein

said video reproducing apparatus connected to a display apparatus includes said means for controlling image reproduction using said event

information data and reproducing image from an event scene selected by a spectator.

17. The digital video reproducing apparatus according to claim 16, wherein
5 said metadata includes reproduction time information related to video
contents;

 said digital video reproducing apparatus comprises a means for
displaying a secondary image, wherein during reproduction of said image or
upon operation by a spectator, said means for displaying the secondary
10 image displays:

 a timeline on a display apparatus screen as a time bar based on
said reproduction time information, wherein said timeline corresponds
to a reproduction time of video contents; and

15 an icon on a starting position of said event scene on the time bar
based on said event information data, wherein said icon corresponds to
said event scene; and

 said means for controlling image reproduction reproduces image from
a starting position of said event scene, said event scene corresponding to
said icon selected by a spectator.

20
18. The digital video reproducing apparatus according to claim 17, wherein
when recognition of said icon by a spectator is difficult when all icons
corresponding to said event scene included in said video contents are
displayed on said time bar, wherein said time bar corresponds to an entire
25 reproduction time of said video contents, said means for displaying the
secondary image displays:

 a portion of said time bar as an expanded time bar, wherein said
portion of said time bar includes a selected position on said time bar;
and

30 an icon on said expanded time bar, wherein said icon corresponds
to an event scene included in said portion of said time bar.

19. The digital video reproducing apparatus according to claim 17, wherein
when recognition of said icon by a spectator is difficult when all icons
corresponding to said event scene included in said video contents are
displayed on said time bar, wherein said time bar corresponds to an entire
5 reproduction time of said video contents, said means for displaying the
secondary image:

determines a selected reproduction time partition, wherein said
reproduction time partition is selected from a timeline corresponding to
an entire reproduction time;

10 displays a scrolling time bar, wherein said scrolling time bar
corresponds to said selected reproduction time partition;

displays said icon on said scrolling time bar, wherein said icon
corresponds to an event scene included in said selected reproduction
time partition;

15 scrolls said selected reproduction time partition, wherein a
direction of scrolling is designated by a spectator;

displays said time bar, wherein said time bar corresponds to a
reproduction time partition after said scrolling; and

20 displays an icon, wherein said icon corresponds to an event scene
included in said reproduction time partition after scrolling.

20. The digital video reproducing apparatus according to claim 17, wherein
when recognition of said icon by a spectator is difficult when all icons
corresponding to said event scene included in said video contents are
25 displayed on said time bar, wherein said time bar corresponds to an entire
reproduction time of said video contents, said means for displaying the
secondary image:

splits and displays said time bar in a plurality of non linear
30 partitions, wherein a time density is set minimum for a partition
selected by a spectator and maximum for a partition located far from
said selected partition; and

displays an icon corresponding to an event scene included in each

EPO 2000 1000 1500 2000 2500 3000 3500 4000

of said partitions, wherein said icon is displayed only when said icon does not overlap with another icon when displayed.

21. A digital video recording and reproducing apparatus, including

5 a means for controlling image reproduction for at least reproducing image based on video contents and metadata, wherein

said video contents including an event scene, wherein said event scene is peculiar to a motion picture; and

10 said metadata comprising at least event information data, wherein said event information data have a designation of a starting position and contents of said event scene; and

said digital video recording and reproducing apparatus connected to a display apparatus, comprises

15 a contents input means for inputting said video contents;

an event information data input means for inputting said event information data; and

a storage means for storing said video contents and said event information data; wherein

20 said event information data is inputted as added to said video contents or separated from said video contents; and

said means for controlling image reproduction uses said event information data and reproduces image from said event scene selected by a spectator.

25 22. The digital video recording and reproducing apparatus according to claim 21, wherein

said metadata includes reproduction time information related to video contents;

30 said digital video reproducing apparatus comprises a means for displaying a secondary image, wherein during reproduction of said image or upon operation by a spectator, said means for displaying the secondary image displays:

a timeline on a display apparatus screen as a time bar based on said reproduction time information, wherein said timeline corresponds to a reproduction time of video contents; and

5 an icon on a starting position of said event scene on said time bar based on said event information data, wherein said icon corresponds to said event scene; and

said means for controlling image reproduction reproduces image from a starting position of said event scene, said event scene corresponding to said icon selected by a spectator.

10

23. The digital video recording and reproducing apparatus according to claim 22, wherein

when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said means for displaying the secondary image displays:

20 a portion of said time bar as an expanded time bar, wherein said portion of said time bar includes a selected position on said time bar; and

an icon on said expanded time bar, wherein said icon corresponds to an event scene included in said portion of said time bar.

25 24. The digital video recording and reproducing apparatus according to claim 22, wherein

when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said means for displaying the 30 secondary image:

determines a selected reproduction time partition, wherein said reproduction time partition is selected from a timeline corresponding to

200 199 198 197 196 195 194 193 192 191 190 189 188 187 186 185 184 183 182 181 180 179 178 177 176 175 174 173 172 171 170 169 168 167 166 165 164 163 162 161 160 159 158 157 156 155 154 153 152 151 150 149 148 147 146 145 144 143 142 141 140 139 138 137 136 135 134 133 132 131 130 129 128 127 126 125 124 123 122 121 120 119 118 117 116 115 114 113 112 111 110 109 108 107 106 105 104 103 102 101 100 99 98 97 96 95 94 93 92 91 90 89 88 87 86 85 84 83 82 81 80 79 78 77 76 75 74 73 72 71 70 69 68 67 66 65 64 63 62 61 60 59 58 57 56 55 54 53 52 51 50 49 48 47 46 45 44 43 42 41 40 39 38 37 36 35 34 33 32 31 30 29 28 27 26 25 24 23 22 21 20 19 18 17 16 15 14 13 12 11 10 9 8 7 6 5 4 3 2 1

an entire reproduction time;

displays a scrolling time bar, wherein said scrolling time bar corresponds to said selected reproduction time partition;

5 displays said icon on said scrolling time bar, wherein said icon corresponds to an event scene included in said selected reproduction time partition;

scrolls said selected reproduction time partition, wherein a direction of scrolling is designated by a spectator;

10 displays said time bar, wherein said time bar corresponds to a reproduction time partition after said scrolling; and

displays an icon, wherein said icon corresponds to an event scene included in said reproduction time partition after scrolling.

25. The digital video recording and reproducing apparatus according to
15 claim 22, wherein

when recognition of said icon by a spectator is difficult when all icons corresponding to said event scene included in said video contents are displayed on said time bar, wherein said time bar corresponds to an entire reproduction time of said video contents, said means for displaying the secondary image:

splits and displays said time bar in a plurality of non linear partitions, wherein a time density is set minimum for a partition selected by a spectator and maximum for a partition located far from said selected partition; and

25 displays an icon corresponding to an event scene included in each of said partitions, wherein said icon is displayed only when said icon does not overlap with another icon when displayed.
